

DATABASE DEVELOPER AND ANALYST

Professional Summary

Analytical database professional with nine years of experience designing, optimizing, and supporting transactional and reporting databases in regulated environments. Strong background in query performance tuning, ETL pipeline development, and stakeholder requirements gathering. Committed to data quality and to producing documentation that outlives individual tenure.

Technical Skills

Databases: Microsoft SQL Server, Oracle, PostgreSQL, MySQL Languages: T-SQL, PL/SQL, Python, C# Reporting and ETL: SSIS, SSRS, Power BI, Informatica Tools: Visual Studio, Git, Azure DevOps, JIRA

Professional Experience

Database Developer and Analyst CompanyName | City, State | 09/2018 to Current - Redesigned the indexing strategy on a 4 terabyte transactional database, reducing average query response time by 62 percent. - Built and maintain twelve production ETL pipelines feeding the enterprise reporting layer, with automated data quality validation at each stage. - Partner with finance and operations stakeholders to translate reporting requirements into dimensional models. - Authored the departmental database standards document, now used for onboarding all new developers. - Led the migration of four legacy reporting solutions onto a consolidated platform.

Database Programmer CompanyName | City, State | 07/2014 to 08/2018 - Developed stored procedures, views, and functions supporting a customer-facing web application serving 80,000 monthly users. - Performed root cause analysis on production incidents and implemented preventive monitoring. - Collaborated with application developers on schema design for three major releases. - Documented data lineage across upstream and downstream systems.

Education

Bachelor of Science, Computer Science CompanyName University | City, State

Certifications

Microsoft Certified: Azure Data Engineer Associate Oracle Database SQL Certified Associate

Additional Professional Experience

Junior Database Analyst CompanyName | City, State | 06/2012 to 06/2014 - Supported daily operations of production and staging database environments. - Assisted senior developers with query optimization and execution plan review. - Produced ad hoc reporting for operations and customer support teams. - Maintained the data dictionary and participated in quarterly access reviews. - Monitored backup completion and escalated failures per the operational runbook.

Selected Projects - Reporting consolidation: retired four overlapping legacy reporting tools in favour of a single platform, reducing licensing cost and eliminating conflicting figures between departments. - Data quality programme: introduced automated validation at every ETL stage, cutting downstream data defects reported by business users by roughly two thirds. - Archive strategy: designed and implemented a partitioning and archival approach for the primary transactional database, holding active table size flat across three years of growth. - Disaster recovery testing: established an annual restore verification exercise covering all tier-one databases.

Methodology and Practice Works within an agile delivery model with two-week iterations and formal code review. Maintains version control discipline for all schema changes through migration scripts. Produces and maintains written documentation for every production object owned by the team. Participates in an on-call rotation supporting production database incidents.

Professional Development Ongoing coursework in cloud data platform architecture. Regular attendee of regional database and analytics user groups.

Additional Technical Exposure Azure Data Factory, Databricks, Snowflake, dbt, Redis, Elasticsearch, Docker, Kafka
